

SOC na sterydach – ochrona organizacji w czasach AI

Konrad Sagała

Cloud Security Architect, Alior Bank

Prelekcja wybrana w wyniku selekcji przez Radę Programową złożoną z uznanych liderów obszaru IT oraz Data Science.

Warszawa,
19.03.2026 - 20.03.2026

OFICJALNA PRELEKCJA WARSAW IT DAYS

TROCHĘ O SOBIE

- Cloud Security Architect – Azure, M365
- Microsoft Certified Trainer
- Microsoft MVP since 2007 – M365 & Security
- Twitter - [@sagus](https://twitter.com/sagus)
- LinkedIn - [@konradsagala](https://www.linkedin.com/in/konradsagala)

Agenda

1. Intro
2. Using Copilot Studio Agents
3. Using Security Copilot Agents

A unified security operations platform

Microsoft Sentinel and Defender XDR together

300+ data sources including:

Prevent

Detect

Investigate

Respond

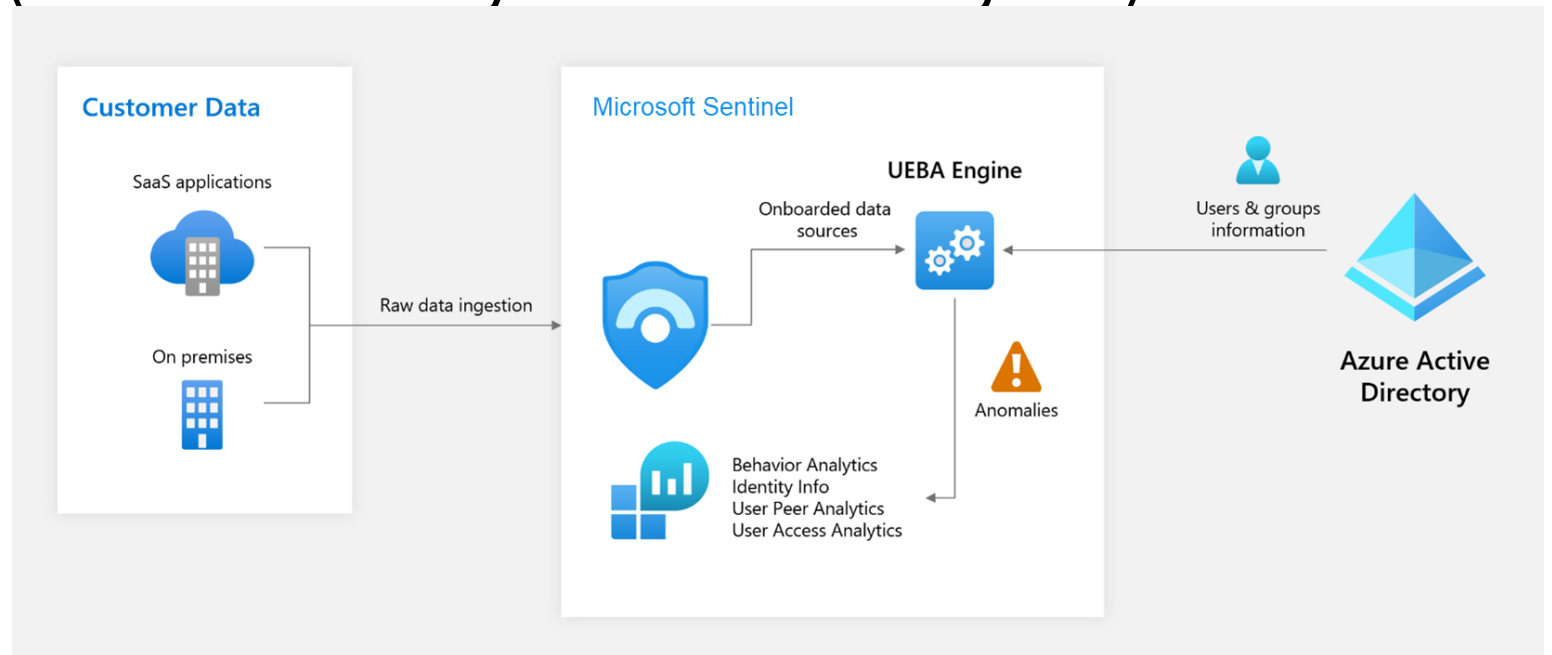

Microsoft Security Experts
Managed services offering

Sentinel AI history

Sentinel was designed to use different AI elements:

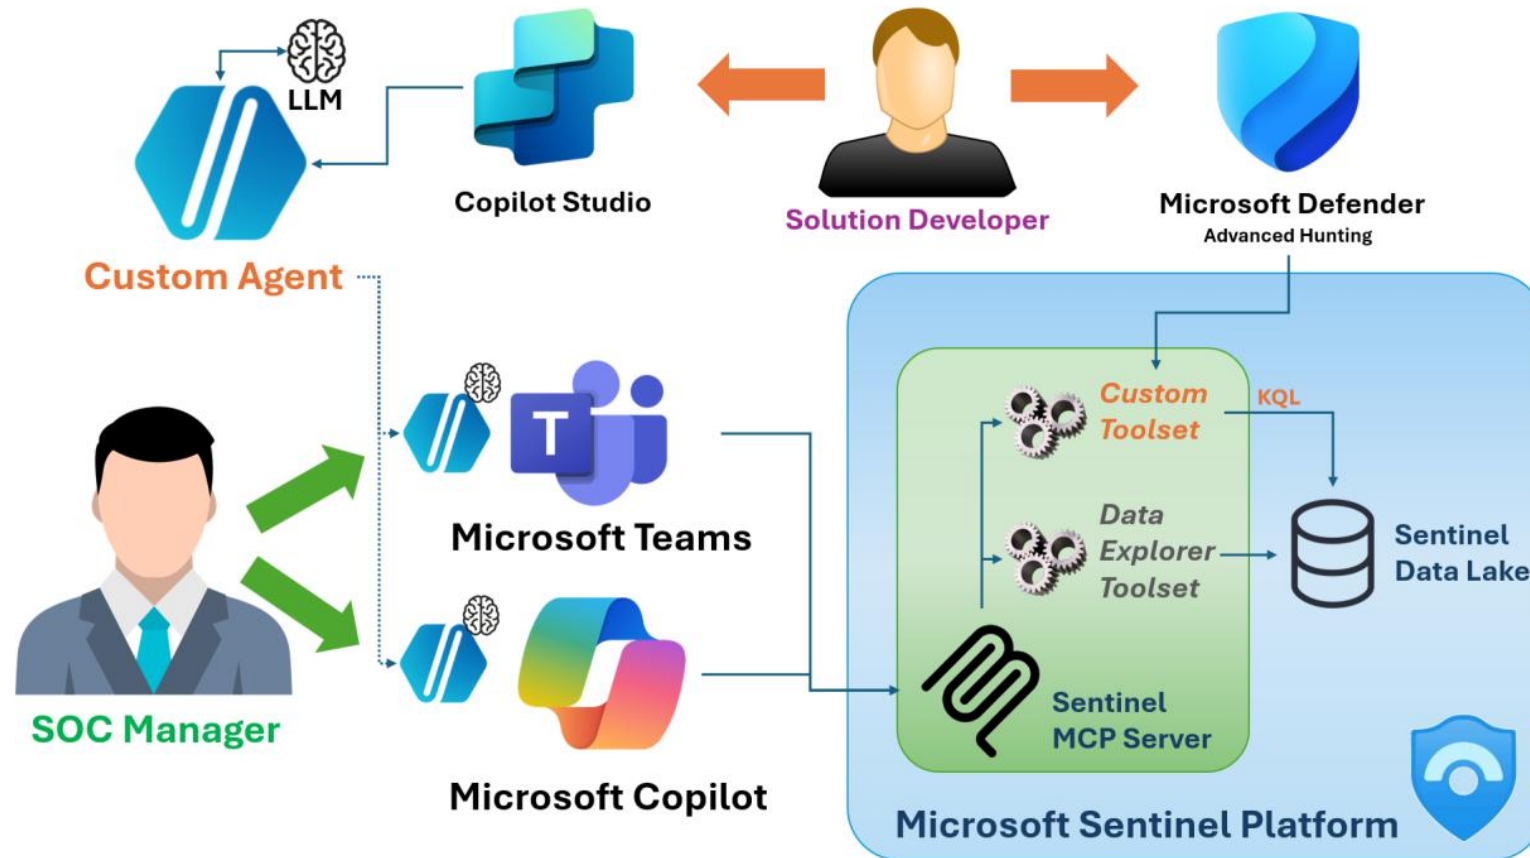

- Hidden ML in UEBA (User and Entity Behavior Analytics)
- Sentinel notebooks in Azure ML
- Threat detection and correlation in Incidents

Sentinel latest updates

- Sentinel DataLake
- Enhanced UEBA
- Microsoft Sentinel Model Context Protocol (MCP) server (Preview)
- Sentinel Graph (preview)
- Generate playbooks using AI in Microsoft Sentinel (preview)

Example of Copilot Studio Agent with Sentinel MCP for SOC manager

Example of Copilot Studio Agent with Sentinel MCP for SOC manager

- Use Copilot Studio to create agent
- Use Defender XDR Advanced Hunting to prepare MCP Toolbox
- Prepare App Registration to Authorize Toolbox
- Add instructions and Toolbox to agent in Copilot Studio
- Add Microsoft Sentinel - Data Exploration MCP Server for the same agent
- Test it and publish to Teams

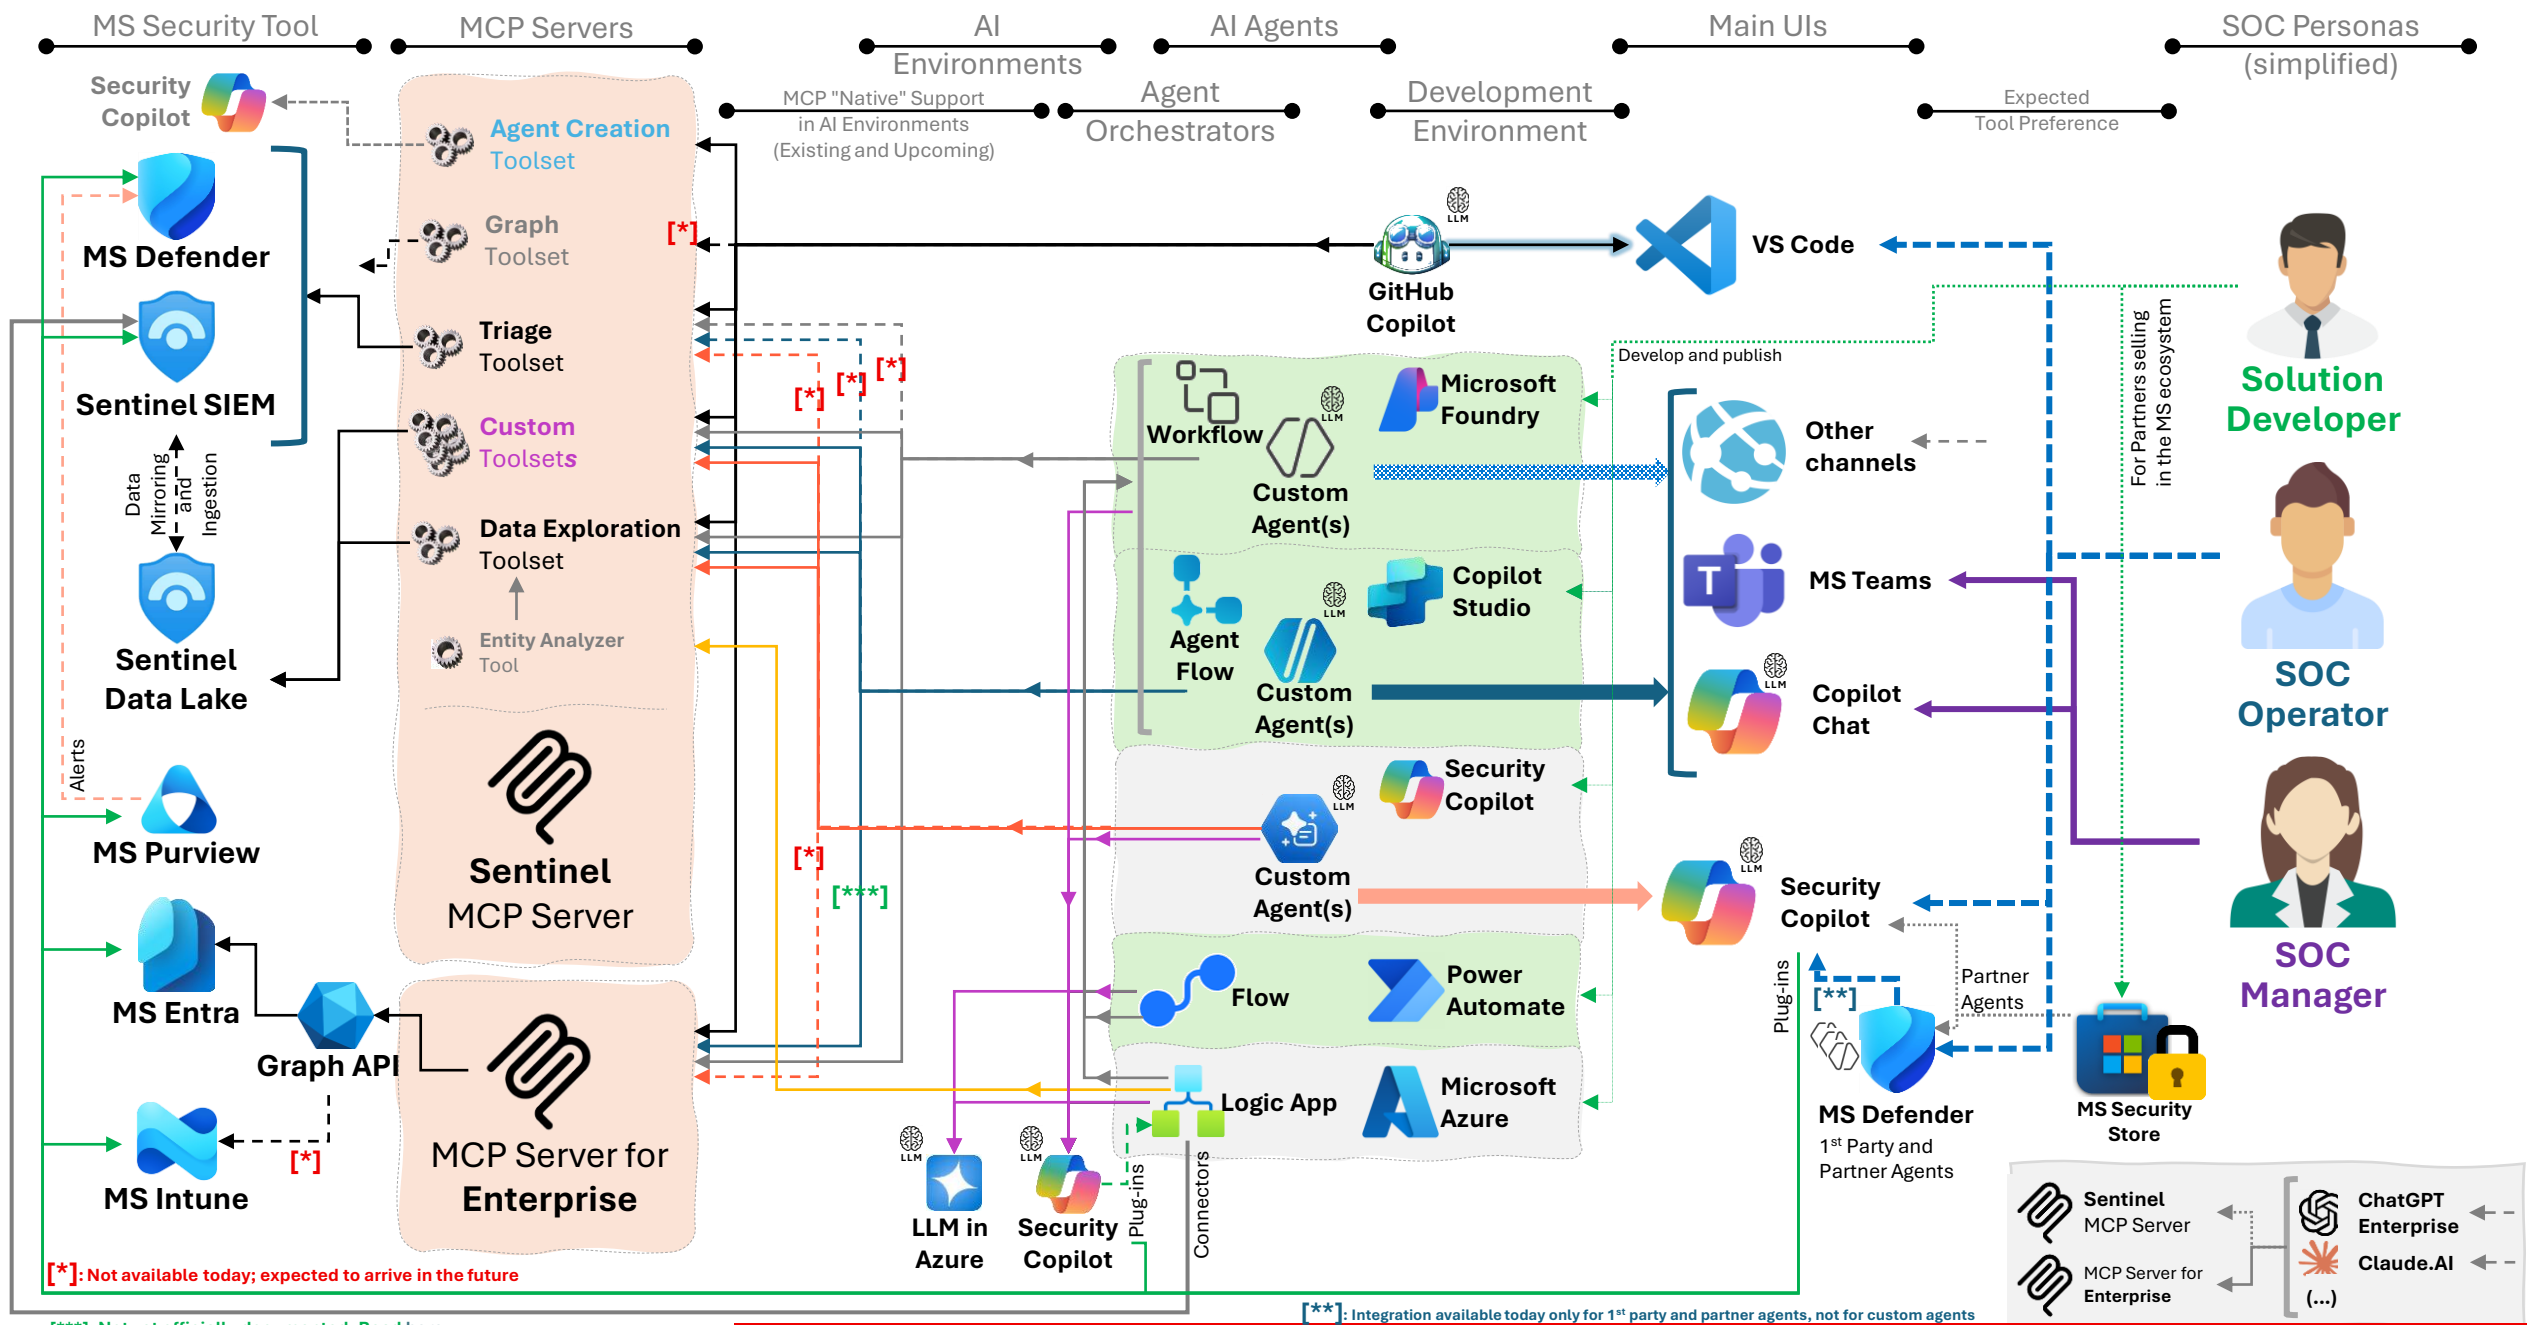

All steps shown in Stefano Pescosolido's Youtube channel

Dynamic Threat Detection Agent

<https://learn.microsoft.com/en-us/defender-xdr/dynamic-threat-detection-agent>

Security Copilot vs Copilot Studio

In common:

- Low/no-code creation of "task-focused" and "conversational" agents.
- Support **multi-agent solutions**, where agents can invoke other agents.

Security Copilot strengths:

- Mostly free for E5 customers [*]
- With GitHub Copilot, offers an agent-driven build experience for custom-agents in VS Code.
- Easily exported as YAML.
- Part of the Security Copilot platform, strongly integrated with the MS security tools (important for Security Operators).

[*] Limit applies

Copilot Studio strengths:

- The cost model is flexible (licenses, credit packs, PAYG on Azure Consumption - Included in M365 Copilot [*])
- Allows you to select the desired LLM from a set of options including the highest-performing models.
- Custom agents can be published on Teams, Copilot and other channels (important for Security Managers).
- Supports the creation of agent-flows, where the interaction logic with LLMs can be defined visually, in addition to using textual instructions.
- Exported as solutions in Power Platform.
- Native integration with Microsoft Foundry.

Cost Components - Custom Agents

GenAI / Agent platform cost:

- For **Security Copilot**: (mostly) free for E5 customers [*]; based on SCUs allocation for non-E5 customers.
- For **Copilot Studio**: licenses or credit packs or PAYG (Azure consumption) - Included in M365 Copilot [*].
- For **Microsoft Foundry**: consumption-based model using AI Compute Units (ACUs). Costs vary by: Model family and size, deployment type.
- For GitHub Copilot: Free "entry-level" tier[1], with limited model capabilities and reduced token/context limits. Paid plans provide full-scale models, higher token budgets, and advanced governance features.

Additional costs:

- **Sentinel Data Lake queries cost** (only for tools querying the Data Lake).
- **Azure Logic Apps**, when called (typically, this component is not relevant)

Dziękuję za oglądanie!
